Lancashire Chemicals

ICESAFE NAC CRYSTAL DE-ICER

Lancashire Chemicals, part of the Plater Chemicals Group, is proud to offer its newly formulated solid de-icer. This new formulation has been developed by the company's technical team, who have more 15 years experience in the de-icer market. Icesafe NAC crystal solid de-icer is a specially developed formulation based on sodium acetate, the environmentally preferred product.

Icesafe NAC crystal is available in 1000kg FIBC's, 25kg and 10kg bags to meet the demands of all sizes of customers from large airports to small car parks. The environmental benefits and superior performance of a sodium acetate based solid de-icer mean that it can be used in many different areas where high performance de-icing is required.

Icesafe NAC will work at temperatures down to - 20°C and below whereas salt, urea and other cheaper de-icers will only be effective just around 0°C. Over the last two winters we have seen temperatures being below -10°C for many days on end and so a significant number of companies have seen the benefit of using a high performance de-icer for their general de-icing needs.

PRODUCT SPECIFICATION

APPEARANCE:	white, coarse granular solid
SODIUM ACETATE:	Minimum 95% (as trihydrate)
PERFORMANCE ADDITIVES:	Minimum 4%
